

Elevating Rack Guard

Protect elevated rack loading and storage areas without sacrificing access.

InCord®
Custom Safety Netting Solutions

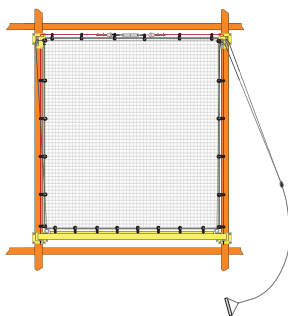

InCord Elevating Rack Guard (ERG) is an actuating system designed to guard and allow access to the same side of a rack. It attaches to existing rack frames with U-bolts and steel brackets that support the load-bearing cables.

- Allows front-of-rack protection without sacrificing access
- Easy one-person pull cord operation to open or close
- Can be configured to open from either top or bottom of the rack bay
- This system is expandable. Convert a single bay into a multi-bay system using shared components.

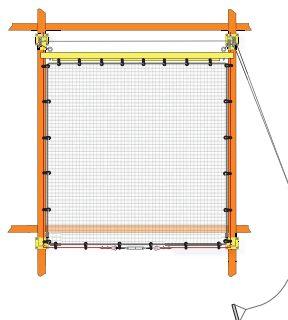

Drop to close or drop to open

Elevating Rack Guard can be configured to open from either the top or bottom of the rack bay.

Drop to close:

Pull the cord to raise the ERG gate open and feed it back to lower closed.

Drop to open:

Feed the cord up to lower the ERG gate open and pull down to raise closed.
