

InCord
Custom Safety Netting Solutions

InCord Green Policy

SUSTAINABLE SOLUTIONS FOR CUSTOM ROPE & NETTING

At InCord, we respect our planet and stress environmentally friendly business practices. We believe in reaching a balance between business and the environment with the daily decisions that we make.

InCord Sustainability and Green Initiatives

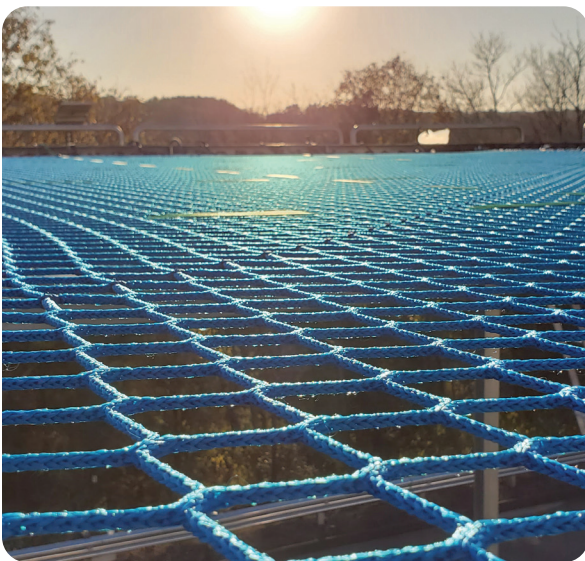

Our diverse sustainability initiatives include a 120 kW solar electric system and a post-production materials recycling program.

In addition, InCord's main office and production building use efficient lighting and energy-saving HVAC. We also keep our production facility landscaped to make the most effective use of shade and water.

Green supply chain purchasing reinforces our sustainable policies in a broad-reaching way. Encouraging others to follow our examples adds a cumulative impact by making ever-changing improvements.

InCord continues to make progress with energy-saving upgrades as well as efficient use of time and workflow. For example, our investment in emerging technologies such as solar voltaic electric has enabled an increased level of energy independence. This investing is not only a socially responsible practice; it is responsible business.

Sustainable Solar Electric Power Generation

Since winter of 2012, InCord has been utilizing an array of Photovoltaic (PV) solar panels on the south-facing roof of our central production facility. The PV solar electric system produces enough energy to meet 90% of the company's yearly energy needs and 100% of our electric usage.

InCord's sustainability vision is to do our part as an industry leader to improve the global ecosystem and foster responsible production practices.
